

# EECE.2160: ECE Application Programming

Fall 2016

## Lecture 21: Key Questions

October 26, 2016

1. **Example:** Complete the following program:

```
#include <stdio.h>
#define NRows 3      // # of rows
#define NCols 4      // # of columns
int main() {
    double x[NRows][NCols] =          // 2-D array
        { { 10,  2.5,  0,  1.5},
          {-2.3, -1.1, -0.2,  0},
          {10.5, -6.1, 23.4, -9.2} };

    int negCnt[NRows] = {0};          // Initialize entire row
                                        // count array to 0
    int i, j;                          // Row and column indices

    /* INSERT CODE HERE--Visit every element in array x and
       count the number of negative values in each row */

    // Now print the row counts
    for (i = 0; i < NRows; i++)
        printf("Row %d has %d negative values.\n",
              i, negCnt[i]);

    return 0;
}
```

2. Explain how to pass arrays to functions.

3. **Example:** Write a function for each of the following:
  - Given an array of doubles (`arr`) and the # of elements in the array (`n`), find the average of all array elements

4. Explain the relationship between pointers and arrays.
