

EECE.2160: ECE Application Programming

Spring 2018

Lecture 20: Key Questions
March 21, 2018

1. Describe how to declare, initialize, and access two-dimensional arrays.

2. **Example:** Complete the following program:

```
#include <stdio.h>
#define NRows 3      // # of rows
#define NCols 4      // # of columns
int main() {
    double x[NRows][NCols] =          // 2-D array
        { { 10, 2.5, 0, 1.5},
          {-2.3, -1.1, -0.2, 0},
          {10.5, -6.1, 23.4, -9.2} };

    int negCnt[NRows] = {0};          // Initialize entire row
                                        // count array to 0
    int i, j;                          // Row and column indices

    /* INSERT CODE HERE--Visit every element in array x and
       count the number of negative values in each row */

    // Now print the row counts
    for (i = 0; i < NRows; i++)
        printf("Row %d has %d negative values.\n",
              i, negCnt[i]);

    return 0;
}
```

3. Explain how to pass arrays to functions.
