

EECE.3170: Microprocessor Systems Design I

Fall 2016

Lecture 29: Key Questions

November 28, 2016

1. Describe the following assembly program, which blinks a single LED:

```
cblock 0x70      ;shared memory accessible from all banks
Delay1           ;Two registers for delay loop in shared mem
Delay2
    endc

    ORG 0
Start:
    banksel      OSCCON      ;bank1
    movlw         b'00111000'   ;set cpu speed of 500KHz
    movwf         OSCCON      ;OSCCON configures
                           ; internal clock
    bcf          TRISC,0      ;Pin C0 = output for DS1
    banksel      LATC        ;bank2
    clrf          LATC        ;Turn off all of the LEDs
MainLoop:
    bsf           LATC, 0     ;turn on DS1

OndelayLoop:
    decfsz       Delay1,f    ;Waste time.
    bra          OndelayLoop ;Inner loop takes 3 inst
                           ; per loop * 256 loops =
                           ; 768 instructions
    decfsz       Delay2,f    ;The outer loop takes an
                           ; additional 3
                           ; instructions per loop
                           ; * 256 loops
    bra          OndelayLoop ;(768+3) * 256 = 197376
                           ; instructions /
                           ; 125K instructions per
                           ; second = 1.579 sec
    bcf          LATC, 0     ;Turn off LED C0

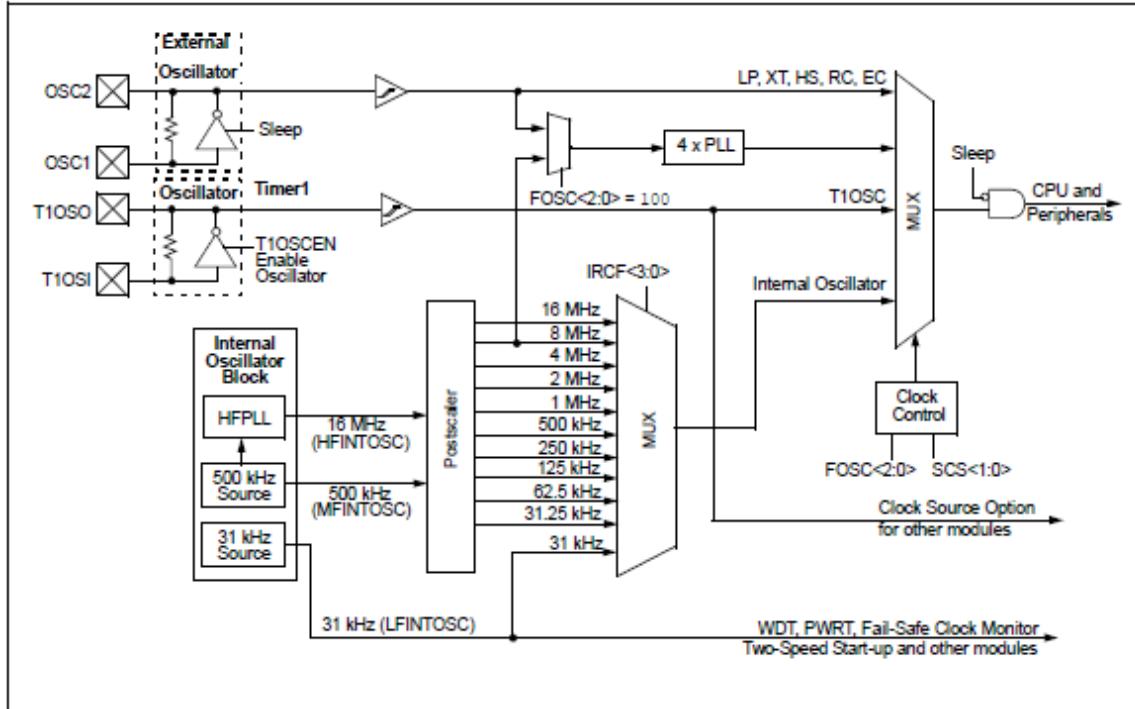

OffDelayLoop:
    decfsz       Delay1,f    ;same delay as above
    bra          OffDelayLoop
    decfsz       Delay2,f
    bra          OffDelayLoop
    bra          MainLoop     ;Do it again...
    end
```

1. Extra space to describe first program.

2. Describe the equivalent program in C, shown below:

```
void main(void) {  
    unsigned int delay; // 16 bit variable  
  
    OSCCON = 0b00111000; //500KHz clock speed  
    TRISCBits.TRISCO = 0; //using pin as output  
    delay = 11250;  
    while (1) {  
        //each instruction is 8us (1/(500KHz/4))  
        while(delay-- != 0) continue;  
  
        LATCbits.LATC0 ^= 1; //toggle LED  
        delay = 11250; //reset delay counter  
    }  
}
```

3. Describe the basic functionality of the PIC16F1829 clock generation module below:

4. Explain the operation of the programs used to rotate the LEDs using an instruction count-based delay loop (rotate.asm and rotate.c).
 5. Explain the features of a typical microcontroller timer module.

6. Explain the operation of the programs used to rotate the LEDs using a timer-based delay loop (timer0.asm and timer0.c).

```

; ****
; Lesson 3 - "Rotate"
;
; This lesson will introduce shifting instructions as well as bit-oriented skip operations to
; move the LED display.
;
; LEDs rotate from right to left at a rate of 1.5s
;
;
; PIC: 16F1829
; Assembler: MPASM v5.43
; IDE: MPLABX v1.10
;
; Board: PICkit 3 Low Pin Count Demo Board

#include <p16F1829.inc>

__CONFIG _CONFIG1, (_FOSC_INTOSC & _WDTE_OFF & _PWRTE_OFF & _MCLRE_OFF & _CP_OFF & _CPD_OFF &
_BOREN_ON & _CLKOUTEN_OFF & _IESO_OFF & _FCMEN_OFF);
__CONFIG _CONFIG2, (_WRT_OFF & _PLLEN_OFF & _STVREN_OFF & _LVP_OFF);

errorlevel -302           ;supress the 'not in bank0' warning
cblock 0x70                ;shared memory location that is accessible from all banks
Delay1                     ;define two file registers for the delay loop in shared memory
Delay2
    endc

; -----LATC-----
; Bit#: -7---6---5---4---3---2---1---0---
; LED: -----|DS4|DS3|DS2|DS1|-
; -----

ORG 0                      ;start of code
Start:
    banksel OSCCON      ;bank1
    movlw b'00111000'    ;set cpu clock speed of 500KHz
    movwf OSCCON        ;move contents of the working register into OSCCON
    clrf TRISC          ;make all of PORTC an output
    banksel LATC        ;select the bank where LATC is (bank2)
    movlw b'00001000'    ;start the rotation by setting DS4 ON
    movwf LATC          ;write contents of the working register to the latch
MainLoop:
OndelayLoop:
    decfsz Delay1,f    ;Waste time.
    goto OndelayLoop   ;The Inner loop takes 3 instructions per loop * 256 loopss = 768 ↵
instructions
    decfsz Delay2,f    ;The outer loop takes an additional 3 instructions per lap * 256 ↵
loops
    goto OndelayLoop   ;(768+3) * 256 = 197376 instructions / 125K instructions per second ↵
    = 1.579 sec.

Rotate:
    lsr f               ;shift the LEDs and turn on the next LED to the right
    btfsc STATUS,C       ;did the bit rotate into the carry (i.e. was DS1 just lit?)
    bsf LATC, 3          ;yes, it did and now start the sequence over again by turning on ↵
    DS4
    goto MainLoop        ;repeat this program forever
    end                  ;end code section

```

; Lesson 9 - Timer0
;
; Timer0 is a counter implemented in the processor. It may be used to count instruction
; cycles or external events, that occur at or below the instruction cycle rate.
; In the PIC18, Timer0 can be used as either an 8-bit or 16-bit counter, or timer. The
; enhanced mid-range core implements only an 8-bit counter.
; This lesson configures Timer0 to count instruction cycles and to set a flag when it rolls
; over. This frees up the processor to do meaningful work rather than wasting instruction
; cycles in a timing loop.
; Using a counter provides a convenient method of measuring time or delay loops as it
; allows the processor to work on other tasks rather than counting instruction cycles.
;
;
; LEDs rotate from right to left, similar to Lesson 3, at a rate of ~.5 seconds.
